## FOREWORD

The agricultural and rural sector in Bangladesh has a particular importance for the sustained food and livelihood security of its large, dense and ever-growing population. The agricultural activities in the country are pursued intensively for the crop as well as allied sectors and in conditions of scarce natural resources. The performance of this sector has a great impact on macro-economic situation like employment generation, poverty alleviation, food security and nutritional attainment etc.

I deeply feel that statistics has been playing an ever-increasing role in shaping up and providing scientific information that is useful in almost every aspect of human life and beyond. Agriculture statistics is a major concern not only for Bangladesh but also for the world as a valuable assistance for formulation of appropriate policy and strategic plan in boosting up the food security and rural development. It is praiseworthy to mention that Bangladesh has a strong agriculture structure which has enabled the country to achieve food sufficiency.

I am happy to know that Bangladesh Bureau of Statistics (BBS) is going to publish the Yearbook of Agricultural Statistics-2017 which is 29<sup>th</sup> issue in the series. This annual publication highlights data on crops area and production, crop damage, weather indicators, agricultural inputs, livestock, fisheries, forestry, prices of selected crops and export-import data on agricultural products.

The Yearbook of Agricultural Statistics-2017 covers a wide spectrum of statistics and indicators belonging to several thematic topics to serve as a reference guide to policy-makers, economists, analysts, academics, educationists, researchers and other users. I hope this publication will be very useful in understanding the wide variety of perspectives of this sector.

I appreciate the work carried out by BBS and would like to express my sincere thanks to Mr. Md. Amir Hossain (Additional Secretary) Director General, BBS for his active stewardship in this case. I also acknowledge hard work and the sincere efforts of officials of Agricultural Wing of BBS who were involved in this exercise. I expect that the users shall continue providing valuable feedback and suggestions for further improvement of such publication since BBS has been striving for excellence.

## **Executive Summary**

The agriculture sector plays an important role in economic development as well as food security of this highly populated country. Historically, agriculture sector is prominent for long in Bangladesh. Reliable Statistics is key to proper planning and successful implementation of activities of all sub-sectors of agriculture.

Bangladesh Bureau of Statistics (BBS) provides reliable production statistics of crops for six major and more than one hundred minor crops since its inception in 1974. BBS also provides bulk of data on crop sub-sector through conducting Agriculture Census that is mainly concerned with crop data and limited data of fisheries and livestock sub-sectors. According to Statistics Act 2013, agriculture census will cover all crops, fisheries and livestock sub-sectors with due importance.

The Yearbook of Agricultural Statistics is published annually by the Agriculture Wing of BBS. The Yearbook is the single largest source of agricultural statistics. This is the 28<sup>th</sup> series of Yearbook of Agricultural Statistics. The major part of yearbook are the findings of survey and census conducted by BBS. The relevant statistics that is collected from secondary sources are also incorporated in the Yearbook.

The time series data (five year) on annual production estimates like area under crop, yield and total production of six major crops (aus, aman, boro, wheat, potato & jute) and one hundred and twenty minor crops have been published in this yearbook. The crop summary indices and crop damage statistics are also shown.

The statistics of other areas of agriculture sector that are published in the yearbook are; agro-ecological information of the country, land types, soil classification, crop seasons, land use statistics, meteorological information like rainfall, temperature, humidity, major cyclonic storms, agricultural inputs, statistics of livestock, fisheries and forestry, crop prices, export and import data of agricultural products and inputs and major findings of agriculture census-2008.

The extensive coverage of the Yearbook of Agricultural Statistics has increased the usefulness and importance of the book of the policy makers, researchers and all relevant stakeholders.

## **INTRODUCTION**

## **1.1 Introduction**

Bangladesh is predominantly an agrarian country. Due to its very fertile land and favorable weather, varieties of crop grow abundantly in this country. Agriculture sector contributes about 15 percent to the country's Gross Domestic Product (GDP) and employs around 41 percent of total labour force.

In order to determine evidence-based policy initiatives, agriculture related statistics are essential. The Yearbook of Agriculture Statistics of Bangladesh is an annual publication and source of this kind of statistics. Agriculture Wing of BBS accumulates compiles and disseminates current crop statistics and other agriculture related data. This Yearbook contains data on crop acreages and production, crop damage, weather variables, agricultural inputs like seeds, fertilizers, agricultural labour wages, irrigation, agriculture holdings, livestock, fisheries, forestry, prices of selected crops and statistics of export-import of agricultural products etc. The objective of this regular publication is to meet the user's demand of current agricultural statistics.

## **1.2 Method of Crop Production Estimation**

### **1.2.1 Agricultural Statistics**

Agricultural statistics consist of structural and annual statistics. The structural statistics are generated collecting data through full count/sample census normally at a regular interval of ten years as per FAO guidelines. The annual agricultural statistics are generated through annual /periodic sample surveys.

### **The Annual Agricultural Estimation System**

The annual agricultural statistics system is designed to:

- Prepare estimate of acreage, yield per acre and production for 126 crops grown in the country ;
- Estimate of crop damages caused by floods, cyclonic storms and other natural calamities;
- Prepare monthly agriculture labour wage rate based on monthly agriculture labour wage survey.
- Prepare annual land utilization and irrigation statistics by districts. Prepare Irrigation statistics of different crops and crop details. and
- Compile the Yearbook of Agricultural Statistics, an annual publication of BBS;

### **1.2.2 Crop Estimation Reporting System**

Selected sample clusters are visited four times in a year and crop-cutting experiment are conducted in due time to estimate the major crops production of Bangladesh. A well-defined Crop Calender is followed to collect data in the field level throughout the year. The collected data is processed, compiled at head office. The findings are disseminated after approval of competent authority.

### **1.2.3 Type of Estimation**

Both subjective (household based interview) and objective (direct observation) methods are used to obtain crop estimates. The subjective method denotes the estimates based on impression. The objective method denotes the method of sample survey in which the main items of information are collected mostly through measurement and observation. The estimates of rice, wheat, potato and jute are made by objective method; for all other crops subjective estimation are followed.

### **1.2.4 The Subjective Estimation Method**

Crop estimation is usually initiated at union levels. The upazila statistical office staff collects the union estimates of the area and yield rate of the crop being estimated. These crop estimates are prepared on the basis of assessment of opinions of farmers interviewed and appraisals of the current crop conditions compared with that of the previous year or of a normal year by the field staff of the upazila statistical office.

The Agricultural Censuses conducted in 1983-84, 1996 and 2008 influence the current estimates of crop areas.

In order to have an element of objectivity in estimation, the field offices of BBS collect area and yield rate of a crop by unions on the basis of assessments of reports of 5 local farmers and their observation of condition of crops in the field. Percentage changes of area of yield rate from previous year are determined on information collected from farmers and field staff's own observation of a crop. Thus, the ratio estimation methodology is followed to get current year estimates.

Upazila crop acreage is the arithmetic sum of union crop acreage and yield per acre is the result of weighted average of union estimates. District estimates are evaluated in relation to (1) prices of crops (2) seasonal characteristics, (3) conditions of the growing plants, (4) damages (if any) and (5) previous year estimates. The country estimates are based on district estimates.

### 1.2.5 The Objective Estimation Method

Cultivations of Aus, Aman, Boro, Wheat, Potato and Jute are widespread. The sample designs of these crops are, therefore, developed considering total land area of the country (excluding urban areas and areas under government reserved forests and big rivers) as universe. The each unit of clusters of plots are sampled across this universe. In order to conduct crop estimation survey for six main crops, BBS uses a total of 10348 clusters each constituted 5 acres of land on an average throughout the country as sample frame. The district is considered as the domain of estimation while the upazilas in a district are considered as strata. The clusters were allocated among the districts proportionately to the size of the district with restriction that the number of cluster in a district is at least 150. At least one cluster was chosen from each union of a upazila. The clusters were formed from cadastral plot listed in the land records. A cluster may have many crops & non-crops plots, each of which has it's own identification number referred to ID number. For each cluster, BBS maintains and updates the list of farmers having fields within the cluster as well as other relevant information regarding farming.

### 1.2.6 Data Collection

The clusters are visited 4 times a year. The acreages of different crops and other utilizations in each cluster are recorded by the field staff in prescribed forms.

### 1.2.7 Area Estimation

**Sample design for estimating the area of each six main crops:** For each six crops, stratified two stage random sampling designs are used. The sample design for each main crop is as follows;

Area under particular crop in clusters is given by

$$P = \frac{\text{area under the crop}}{\sum_{i=1}^{Nd} ai} = \frac{a'}{\sum_{i=1}^{Nd} ai}$$

Area under particular crop (each six main crop) in district d is given by

$$\hat{A}_d = NP$$

The cluster term reports are edited, compiled and analyzed in head office for estimating areas of Aus, Aman, Boro, Wheat, Potato and Jute crops by varieties separately and combinedly. The total acreage figure of a crop is obtained districtwise by using the method of ratio estimation. The acreage estimates of crops by district are obtained by ratio method of expansion as follows;

Area for a crop for the district	=	Effective area for the district	x	Area ratio devoted to the crop for the district
----------------------------------	---	---------------------------------	---	---

Where,

Effective area for the district	=	Total land area for the district	-	Area not utilized for agricultural purposes for the district
---------------------------------	---	----------------------------------	---	--

Area ratio devoted to the crop for the district	=	Sum of area devoted to the crop from plots within the clusters for the districts
		Sum of areas of corresponding clusters for the district

### 1.2.8 Yield Rate Estimation

For estimating yield rates of the main crops (Aus, Aman, Boro, Wheat, Potato and Jute), sample crop cutting surveys are conducted. A large sub-sample of clusters is taken for each of the survey. The sampling design for yield estimation of each main crop is stratified two-stage random sampling design with different districts in the country serving as domains of study. Different upazilas are considered the strata. In each district 50 (fifty) sample crop cutting experiments are done in the sample cluster. The total number of crop cutting is distributed among the upazilas (sub-districts) according to the proportion of area coverage for each crop in the previous year. The first stage units (FSUs) of the sample design are the selection of clusters of land where crop is grown. A field (the smallest demarcated area in a cluster) in the cluster is the second stage sampling unit (SSU). A plot (crop cutting area) in the field where the crop under study grown is reflected for conducting crop cutting experiment.

#### District Level Estimate

Weighted average yield of the crop in d-th district,

$$\bar{y}_d = \frac{\sum_h A_{dh} \bar{y}_{dh}}{\sum_h A_{dh}}$$

is the estimator of rice yield for the district

Where,  $\bar{y}_d$  = average yield of crop in district d

$A_{dh}$  = total crop area in h-th stratum of district d

$\bar{y}_{dh}$  = average yield of crop in the h-th stratum of district d

The district level variance of yield estimator is given by

$$V(\bar{y}_d) = \frac{1}{A_d^2} \sum_h A_{dh}^2 \left( \frac{1}{n_{dh}} - \frac{1}{N_{dh}} \right) S_{dh}^2$$

The district level estimate of variance is given as:

$$\hat{V}(\bar{y}_d) = \frac{1}{A_d^2} \sum_h A_{dh}^2 \left( \frac{1}{n_{dh}} - \frac{1}{N_{dh}} \right) s_{dh}^2$$

The estimated percentage standard error at the district level is given as:

$$\hat{CV}_d = \frac{\sqrt{\hat{V}(\bar{y}_d)}}{\bar{y}_d} \times 100$$

Where,  $N_{dh}$  = total of fields growing specific crop in h-th stratum of district d

$n_{dh}$  = sample number of fields growing specific crop in h-th stratum of district d

$A_d$  = total estimated area of specific crop in district d

$S_{dh}^2$  = sample variance from h-th stratum of district d

### National Level Estimate

The overall weighted yield estimate at the national level is given by:

$$\bar{y} = \frac{1}{A} \sum_d^D A_d \bar{y}_d$$

The overall estimate of variance is given by:

$$\hat{V}(\bar{y}) = \frac{1}{A^2} \sum_d^D A_d^2 \hat{V}(\bar{y}_d)$$

The overall estimated percentage standard error is given as:

$$\widehat{CV} = \frac{\sqrt{\hat{V}(\bar{y})}}{\bar{y}} \times 100$$

### Sample Crop Cutting Method of Rice (Aus, Aman & Boro)

The method followed is a circular cut of total area 215.278 sq. ft. (20 sq meters) with a radius of 8.278 ft,. In sample plot selected following statistical procedure, one random point is determined and keeping that point in the centre, the circle is delineated by means of an appliance with an arm of fixed length (8.278 ft.) attached to it. A stylus is also attached for marking crop plants to be cut. Rice from the harvested sample plants is threshed and winnowed and green weights are recorded. For recording the moisture, moisture meter is used. In Bangladesh 14% moisture in the case of paddy is considered as standard after drying. The formula for conversion of produce of paddy into rice followed in Bangladesh is given below:

$$\text{Rice} = \text{paddy} \times \frac{2}{3}$$

### Sample Crop Cutting Method of Wheat

The sample crop cutting is conducted in the selected plot in the cluster. The sample plot (area of crop cutting) is determined following statistical procedure. The method followed is a circular cut of total area 50 sq. feet (approx) with a radius of 4 ft. Wheat from the harvested sample plants is threshed and winnowed and green weight and weight after drying is recorded. Thus, the weighted yield of wheat per area is obtained.

### Sample Crop Cutting Method of Potato

To conduct sample crop cutting for potato, a field in the randomly selected cluster is randomly selected. As potato is planted in rows, two rows are randomly selected among total. Then the area under selected row is measured through adding the length in feet of each selected row multiplied by the average width per row in the field. Afterwards the Potato for selected two rows are harvested and cleaned. Then taking the harvested area and the weight of harvested Potato into consideration, the yield rate per acre is estimated.

### Sample Crop Cutting Method of Jute

The sample crop cutting is conducted in the selected plot of the selected cluster. The sample plot (area of crop cutting) is determined following statistical procedure. The method followed is a circular cut having total area of 50 sq. feet (approx) with a radius of 4 ft. The bundle of jute is kept under water for few days. After some days the rotten Jute is separated from the stalks, cleaned and dried. Then the weight is taken and the yield per acre is estimated.

## 1.2.9 Production Estimation

Multiplying area and yield rate figures, production estimates of the crops are derived separately for each district. Country estimates are obtained summing up estimates of districts. Yield rates at country level are all weighted averages of district figures.

The major soils are grey to olive, deep, calcareous silt loam and silty clay loams and are stratified either throughout or at shallow depth. Calcareous Alluvium and Noncalcareous Grey Floodplain soils are the dominant general type. The soils in the south become saline in dry season. Top soils and subsoils of the area are mildly alkaline. General fertility is medium but low in organic matter.

Silt loam soils predominate on highlands and silty clay to clay in lowlands. Noncalcareous Dark Grey Floodplain soils are the only general type of the area. Organic matter content of the soils are moderate. Moisture holding capacity is medium. Topsoils are moderately acidic, but subsoils neutral in reaction. General fertility level is medium.

The soils are grey, heavy silty clay loams on the ridges and clays in the basins. Noncalcareous Grey Floodplain soils are the only general type. Organic matter content of soils is moderate. The reaction of soils ranges from strongly acidic to neutral.

*Location: Sylhet, Moulvi Bazar, Sunamganj and Habiganj districts.*

### **AEZ-21: Sylhet Basin**

The region occupies the lower western side of Surma-Kusiyara Floodplain. The area is mainly smooth broad basins with narrow ridges of higher land along the rivers.

Soils of the area are grey clays in the wet basins and silty clay loams and clay loam on the higher parts which dry out seasonally. Noncalcareous Grey Floodplain soils and Acid Basin Clays are the major components of the general soil types. The soils have moderate content of organic matter and soil reaction is mainly acidic. Fertility level is medium to high.

*Location: Large parts of Sunamganj, Habiganj, Netrokona, Kishoreganj and Brahmanbaria districts.*

### **AEZ-22: Northern and Eastern Piedmont Plains**

This is a discontinuous region occurring as a narrow strip of land at the foot of the northern and eastern hills. The area comprises merging alluvial fans which slope gently outward from the foot of the hills into smooth low lying basin.

Grey Piedmont soils and Noncalcareous Grey Floodplain soils are the major general soil types of the area. Soils of the area are loams to clays in texture having slightly acidic to strongly acidic reaction. General fertility level is low to medium.

*Location: Sherpur, Netrokona, Sunamganj, Sylhet, Moulvi Bazar, Habiganj, Brahmanbaria and Cumilla districts.*

### **AEZ-23: Chattagram Coastal Plain**

This region occupies the plain land in greater Chattagram district and the eastern part of Feni district. It is a compound unit of piedmont, river, tidal and estuarine floodplain landscapes.

Grey silt loams and silty clay loam soils are predominant. Acid Sulphate soils which are potentially extremely acidic occur in mangrove tidal floodplains. Noncalcareous Grey Floodplain soils, Noncalcareous Alluvium and Acid Sulphate soils are the major components of general soil types of the area. General fertility level of soils is medium. Organic matter content is low to moderate.

*Location: Feni, Chattagram and Cox's Bazar districts.*

### **AEZ-24: St. Martin's Coral Island**

This small but distinctive region occupies the whole of St. Martin's Island in the extreme south of the country. The area has very gently undulating old beach ridges and inter-ridge depressions surrounded by sandy beaches.

The soils are developed entirely on old and young coral beach sands. Calcareous Alluvium is the only general soil type of the area. General fertility level is low with poor moisture holding capacity.

*Location: St. Martin's, Island*

### **AEZ-25: Level Barind Tract**

This region is developed over Madhupur Clay. The landscape is almost level and locally irregular along river channels. The predominant soils have a grey silty paddled topsoil with plough pan which either directly overlies grey heavy little weathered Madhupur Clay or merges with the porous silt loam or silty clay loam subsoils having strongly acid clay at greater depth. Shallow Grey Terrace soils and Deep Grey Terrace soils are the major components of general soil types of the area. The soils are low in available moisture holding capacity and slightly acidic to acidic in reaction. Organic matter status is very low and most of the available nutrients are limiting.

*Location: Dinajpur, Gaibandha, Joypurhat, Bogura, Naogaon, Sirajganj and Natore districts.*

### **AEZ-26: High Barind Tract**

It includes the western part of Barind Tract where the underlying Madhupur Clay has been uplifted and cut into by deep valleys.

The soils include paddled silt loam to silty clay loam in the topsoils and porous silt loam with mottled plastic clay at varying depth. Deep Grey Terrace soils and Grey Valley soils are the major components of general soil types of the area. General fertility status is low having low status of organic matter.

*Location: Rajshahi, Chapinawabgonj and Naogaon districts.*

### **AEZ-27: North Eastern Barind Tract**

This region occupies several discontinuous areas on the north-eastern margins of Barind Tract. It stands slightly higher than adjoining floodplain land.

The region has silty or loamy topsoil and clay loams to clay subsoils and grades into strongly mottled clay. The Madhupur Clay underlying this region is deeply weathered. Deep Red Brown Terrace soil and Deep Grey Terrace soils are the major components of general soil types of the area. The soils are strongly acidic in reaction. Organic matter of the soils is low. General fertility level is poor.

*Location: Dinajpur, Rangpur, Gaibandha, Joypurhat and Bogura districts.*

### **AEZ-28: Madhupur Tract**

This region of complex relief and soils developed over the Madhupur Clay. The landscape comprises level upland, closely or broadly dissected terrace associated with either shallow or broad, deep valleys.

Eleven general soil types exist in the area; of which, Deep Red Brown Terrace, Shallow Red Brown Terrace soils and Acid Basin Clays are the major ones. The soils on the terrace are better drained, friable clay loams to clays overlying friable clay substratum at varying depth. Soils in the valleys are dark grey heavy clays. They are strongly acidic in reaction with low status of organic matter, low moisture holding capacity and low fertility level.

*Location: Dhaka, Gazipur, Narsindi, Narayanganj, Tangail, Mymensingh and Kishoreganj.*

### **AEZ-29: Northern and Eastern Hills**

This region includes the country's hill areas. Relief is complex. Hills have been dissected to different degrees over different rocks. In general, slopes are very steep and few low hills have flat summits.

The major hill soils are yellow-brown to strong brown permeable friable loamy, very strongly acidic and low in moisture holding capacity. However, soil patterns generally are complex due to local differences in sand, silt and clay contents of the underlying sedimentary rocks and in the amount of erosion that has occurred. BrownHill soils are the predominant general soil type of the area. Organic matter content and general fertility level is low.

*Location: Mainly in Khagrachhari, Chattagram Hill Tracts, Bandarban, Chattagram, Cox's Bazar, Habiganj and Moulvi Bazar districts, small areas along the northern border of Sherpur, Mymensingh, Sunamganj and Sylhet districts in central and south eastern Sylhet and in the east of Brahmanbaria, Cumilla and Feni districts.*

This small region lies on the eastern border of Brahmanbaria and southwest corner of Habiganj districts. In appearance, the region resembles Madhupur Tract with level upland dissected by mainly deep broad valleys.

The main soils on the upland have strong brown clay which grades into red mottled clay substratum. The valley soils range from silty clay loams to clays. Deep Red Brown Terrace soil, Grey Piedmont soils and Acid Basin Clays are the major components of general soil types of the area. The general fertility including organic matter status is low. The soils are strongly acidic in reaction.

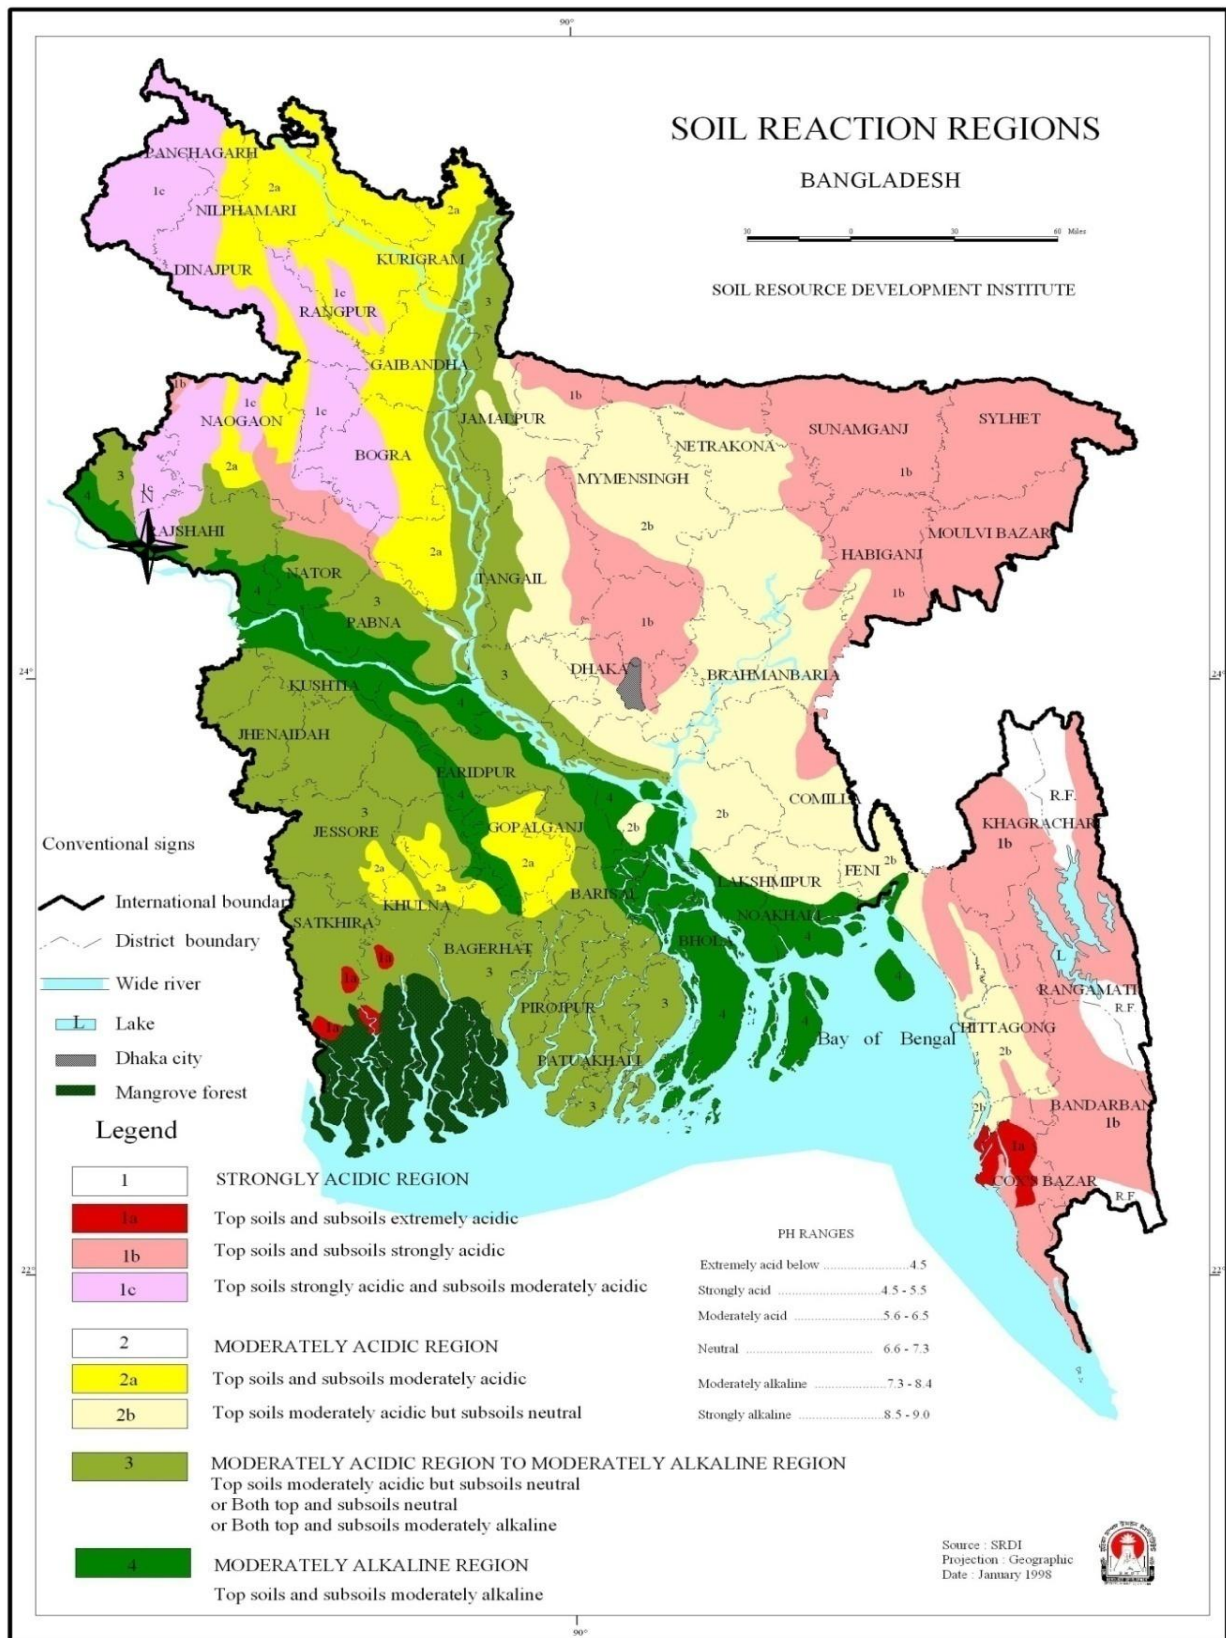

*Location: Brahmanbaria district and minor area in Habiganj district.*

All the physiographic units and agro-ecological zones are displayed separately on two maps (Map-1 and Map-2).

## 1.5 Land Levels in Relation to Flooding

The distribution of land levels in relation to seasonal flooding is shown in Map-3. The information has been provided in terms of depth of flooding phases. The terms used have the following meanings:

- |                      |   |
|----------------------|---|
| Highland (H)         | : Land which is above normal flood-level.   |
| Medium Highland (MH) | : Land which is normally flooded about 90 cm deep during the flood season.                |
| Medium Lowland (ML)  | : Land which is normally flooded between 90 cm. and 180 cm. deep during the flood season. |
| Lowland (L)          | : Land which is normally flooded between 180 and 300 cm deep during the flood season.     |
| Very Lowland (VL)    | : Land which is normally flooded deeper than 300 cm during the flood season.              |

An additional class, Bottomland, is recognized for depression sites in any land level class which remains wet throughout the year. The Medium Highland land type has been divided into two subclasses: MH-1, normally flooded upto about 30 cm deep; and MH-2, normally flooded between 30 -90 cm deep. Neither these subclasses nor Bottomland are shown separately in the map.

It is important to realize that the depth limits between the depth of flooding classes are not as rigid as the definitions might suggest. Flood-levels in an area may, in fact, vary by as much as a metre or more over different years. They may also reach their peak levels for only a few days at a time during a particular year. They may also reach their peak levels for only a few days at a time during a particular year. What these classes indicate is the level of flooding which farmers expect when they decide which crops to grow in the kharif season on their different kinds of land, based on their long experience of cultivation on particular sites:

- Highland may be suitable for kharif or perennial dry land crops if the soils are permeable. Impermeable soils - or soils which can be made impermeable by puddling - may be suitable for transplanted Aus and/or Aman paddy if bunds are made to retain rainwater on fields.
- Medium Highland is suitable for crops which can tolerate shallow flooding, such as broadcast or transplanted Aus paddy, jute and transplanted Aman paddy. Early kharif dry land crops which mature before flooding starts can be grown on permeable soils, and late kharif and early rabi dry land crops on soils which drain in September-October.
- Medium Lowland is flooded too deeply for transplanted Aus or transplanted Aman paddy to be grown safely. Mixed broadcast Aus and deepwater Aman is a common practice; or long Aman seedlings may be transplanted if floodwater recedes early enough. Dry land rabi crops are widely grown on soils which drain in October or November.
- Lowland is flooded too deeply for broadcast Aus or transplanted Aman to be grown. Deepwater Aman is typically grown on such land (although the cultivation of irrigated Boro paddy on such land in the dry season now precludes the cultivation of deepwater Aman over considerable areas of lowland). Dry land rabi crops can only be grown if floodwater recedes before December.

- Very Lowland generally is too deeply flooded for even deepwater Aman to be grown (this is not necessary because of the depth of flooding but because of such associated characteristics as early flooding, rapid flooding or wave action on large open bodies of water, as in the Sylhet Basin). Where cultivated, very Lowland is generally used for irrigated Boro paddy, either HYV or local varieties.
- Bottomland stays too wet for paddy to be sown broadcast. The traditional crop on such land is local Boro paddy, either not irrigated or irrigated by traditional low-lift irrigation devices. In a few other areas where flooding normally does not exceed about 1.5 m deep very long Aman paddy seedlings are transplanted early in the monsoon season.

The above flood-depth classes are shown on the map as subdivisions of the soil units. As with the soil units themselves, it must be realized that the information given on flooding characteristics is highly generalized. It is to be noted that several flood-depth classes can occur within a single village in floodplain physiographic units. But the map shows either the most extensive class (or classes) occurring in the soil unit (e.g., Highland or Highland and Medium Highland) or the range of classes which cover important areas within the unit if more than two classes occur (e.g., Medium Lowland to Very Lowland). Where two classes are named, the more extensive one is named first. Where a range of classes is indicated, they are referred in sequence from highest to lowest position in the landscape, regardless of their relative extents.

## 1.9 Physiography of Bangladesh

Bangladesh forms the largest delta in the world and is situated between  $88^{\circ}10'$  and  $92^{\circ}41'$  East longitudes and between  $20^{\circ}34'$  and  $26^{\circ}38'$  North latitudes. The great delta is flat throughout and stretches from near the foot-hills of the Himalayan Mountains in the north to the Bay of Bengal in the south.

The vast plain is washed by mighty rivers-the Meghna, the Padma, the Jamuna and the Karnafuli and their numerous tributaries. Tropical monsoon rains drench the land and the rivers. Onrush of rain waters in summer overflows their banks flooding low and outlying areas every year.

The monotony of flatness has been relieved inland by two elevated tracts-the Modhupur and the Barind tracts, and on the north-east and south-east by rows of hilly forests. The great plain lies almost at sea level along the southern coast and rises gradually towards north. The maximum elevation above the mean sea level is 4034 feet at Keocradang Hill in Rangamati Hill district. The topography, however, variable and can be divided into the following five classes.

### 1. High Land

The area is relatively high and cannot hold waters during monsoon. Some waters are retained by raising "bandhs" around fields. The area spreads over Modhupur Garh in Tangail and Mymensingh district, Bhaoal's Garh in Gazipur and Dhaka district, Barind tract in Rajshahi Division, Lalmai area in Cumilla and "Tilla" areas in Sylhet, Moulvi Bazar and Habiganj district.

### 2. Medium Highland

The land which is normally flooded up to about 90 cm. depth during the rainy season for more than two weeks continuously. The area spreads over Barishal division, major parts of Khulna division, northern part of Rajshahi division and parts of Gazipur, Narsindi, Noakhali, Feni, Lakshmipur, Cumilla and Habiganj district.

### 3. Medium Lowland and Low Land

Medium Lowland is normally flooded between 90cm. and 180 cm. depths and low land is normally flood between 180cm. and 275 cm. depth during the monsoon season. The area spreads over major parts of Cumilla, Brahmanbaria, Chandpur, Gopalganj district and parts of Lahskmpur, Noakhali, Serajganj, Natore and Naogaon district, northern parts of Khulna and Bagherhat district, minor of Jashore, Kishorganj and Habiganj district.

### 4. Very Low Land

The land consists of haors, bills, canals and other low lying areas which looks like large lakes during rainy season. Depth of water may rise as high as 30 feet. In winter, waters dry up except in the centre. Most of the haors and bills lie in Sylhet division and in Kisoreganj and Netrokona district.

### 5. Hilly Land

The land spreads over Rangamati, Bandarban and Khagrachari Hill Districts, parts of Chattagram, northern parts of Mymensingh, north and southern parts of Sylhet division, eastern border of Cumilla and north eastern strip of Feni district.

F.N They often differ slightly from the totals of the rounded figers of corresponding individual crops. Like wise, yield rates correspondto full figures of area and production and hence most cases they differ slightly from yield corresponding to rounded area and production figures.

## Estimates of Aus Rice (husked) 2016-2017

### Introduction:

Aus is one of the major crops in Bangladesh. It has been contributing to food production in addition to other two rice (Aman and Boro) crops. The weather condition for Aus cultivation was favorable in this year but due to lower productivity as compared to two other rice crop Aman and Boro , farmers are reluctant to produce Aus. The contemporary crops are becoming profitable day by day.

In a subjective manner, farmers were interviewed on some management issues of seed and fertilizer. They opined that due to government support as well as favorable weather conditions, the production of rice remains almost same in relation to the previous year.

### Area:

Total area under Aus crop has been estimated at 0.94 million hectares this year as compared to 1.18 million hectares in last year which is 7.49% lower than that of last year. The total area of this year and the last year of Aus by variety are as follows;

**Table-1 : Estimates of Total Area by Type of Aus Crop**

Variety	2015-2016		2016-2017		Percentage (%) changes over previous year
	Area (in acres)	Area (in hectares)	Area (in acres)	Area (in hectares)	
Local Aus	5,23,605	2,11,891	4,65,703	1,88,460	(-) 11.06
HYV Aus	19,91,898	8,06,077	18,61,285	7,53,221	(-) 6.56
Total Aus	25,15,503	10,17,968	23,26,988	9,41,681	(-) 7.49

## Yield Rate:

Average yield rate of 2016-2017 has been estimated at 2.266 metric tons per hectare which is 0.80% higher than that of last year. Estimates of yield rates by varieties and combined average yield rate of all varieties are as follows;

**Table-2 : Estimates of Yield Rates by Type of Aus Crop**

## Production:

Total Aus production (husked) of 2016-2017 has been estimated at 2.13million metric tons as compared to 2.29 million metric tons in last year which is 6.77%lower. Estimates of production by varieties and combined total of Aus are as follows;

**Table-3 : Estimates of Production by Type of Aus Crop**

## Estimates of Aman Rice (Husked), 2016-17

### Introduction

Aman is one of the main crops in Bangladesh. It is the second largest rice crop in the country in respect to the volume of production while Boro tops the production. It is notable that the area coverage of Aman is the largest as a single crop and Boro remains the second. The production of Aman depends on the weather condition of the country and farmers usually cultivate Aman in their land

In the year 2016, favourable weather condition prevailed all over the country from sowing to harvesting period of Aman. In a subjective manner, farmers were interviewed on some points relating to management system of seed, fertilizer, and rural electricity supply. They opined that proper management and timely distribution of seed, fertilizer, uninterrupted supply of electricity, Adequate rain water led to increase in production of Aman rice in 2016. Although the area remains almost same to the previous year.

#### Area:

## Estimates of Boro Rice (Husked), 2016-2017

### Introduction

Boro is the most important and single largest crop in Bangladesh in respect of volume of production. It has been persistently contributing to higher rice production in last successive years. The weather condition for boro cultivation was favorable in the growing stage of this year. But due to flash flood in some northern and north-east districts, (boro) crop under 296701 hector of land was fully damaged for 2016-17. In a subjective manner, farmers were interviewed on some points relating to management system of seed, fertilizer and rural electricity supply. They opined that proper management and timely distribution of seed, fertilizer and stable supply of electricity led to higher yield of boro this year.

### Area

Total area under boro crop has been estimated 1,11,06,337 acres (44,75,876 hectares) in this year as compared to 1,17,99,512 acres (47,72,576 hectares) of the last year. The harvested area has decreased by 6.217% this year. Comparative area estimates are shown below:

### Estimates of Total Area by Type of Boro Crop

## Estimates of Wheat, 2016-17

### Introduction

The cultivation of wheat in Bangladesh has been decreased this year in relation to previous year. DAE discouraged to cultivate wheat the farmers of south-west districts due to blast disease at last year. This discouraging program of government agency is to consider as main reasons of decreased area of wheat.

In a subjective manner, farmers were interviewed on some points relating to management and distribution system of seed and fertilizer. Observing the field reports it revealed that good management and distribution system of seed and fertilizer brings significantly increased Yield rate (4.19%) of this crop.

### Area

The total area under wheat crop has been estimated 10,26,343 acres (4,15,339 hectares) compared to 10,99,158 acres (4,44,805 hectares) of the last year. Comparative area estimates are shown below:

#### Estimates of Total Area of Wheat Crop

Crop	2015-2016		2016-2017		Percentage changes over previous year
	Area (in acres)	Area (in hectares)	Area (in acres)	Area (in hectares)	
Wheat	10,99,158	4,44,805	10,26,343	4,15,339	(-)6.624%

## Yield

The weather condition was favourable during sowing period in the survey year 2016-17. Average yield rate of wheat has been estimated 34.23 maunds per acre (3.158 metric tons per hectare) which is 4.19% higher than that of last year. Comparison of estimated yield rates of wheat is shown below:

#### A. Estimates of Fibers

##### 3.6 (a) Major Fibers

#### Estimates of Jute 2016-2017

##### Introduction:

Jute is an eminent cash crop of Bangladesh. Farmers of some regions cultivate jute on regular basis. In a subjective manner, farmers were interviewed relating to cultivation of jute. They opined that due to reasonable market price, favourable weather condition and availability of water for rotation, jute cultivation has increased remarkably in this year.

##### Area:

Total area under jute crop has been estimated at 18,23,104 acres (7,37,770 hectares) this year which is 8.87% higher than that of last year. Comparative area estimates of jute crop of 2015-16 and 2016 -2017 are as follows:

**Table-1 : Estimates of Total Area of Jute Crop**

2015-16		2016 -2017		% Change over previous year
Area (in acre)	Area (in hectare)	Area (in acre)	Area (in hectare)	
16,74,611	6,77,678	18,23,104	7,37,770	(+) 8.87

##### Yield Rate:

Average yield rate has been estimated at 4.51 bales per acre (11.154 bales per hectare) this year which is 0.22% higher than that of last year. Average yield rate of this year as well as the last year are computed as follows;

**Table-2 : Estimates of Yield Rate of Jute Crop**

2015-16		2016 -2017		% Change over previous year
Yield rate per acre (Bales)	Yield rate per hectare (Bales)	Yield rate per acre (Bales)	Yield rate per hectare (Bales)	
4.51	11.154	4.52	11.178	(+) 0.22%

Note: Above total figures are weighted figures

##### Production:

Total jute production in this year has been estimated at 82,46,797 bales which is 9.10% higher than that of last year. Total production figures of this year and the last year are as follows

**; Table-3 : Estimates of Total Productionf Jute Crop**

Production (Bales)		% Change over previous year
2015-16	2016 -2017	
75,58,934	82,46,797	(+) 9.10

Estimates of Area, Yield rates and Production by districts and by divisions are furnished in the table appended.

## Estimates of Potato, 2016-17

### Introduction

Potato is a prominent crop in consideration of production and its internal demand in Bangladesh. Potato cultivation has been getting popular over the last couple of years. The weather condition for potato cultivation was favorable during the sowing, growing and harvesting period of the survey year 2016-17. The area of local variety increases with regard to previous year. It was found that the farmers were interested to grow more high yielding variety.

In a subjective manner, farmers were interviewed on some points relating to management and distribution system of seed and fertilizer. They opined that proper management and timely distribution of seed and fertilizer led to a substantial higher production this year. At the same time no natural calamity was reported during potato cultivation and its harvesting. As a result, the area and yield rate has significantly increased, which contributed 7.83% increase in total volume of production.

### Area

Total area under potato crop has been estimated 12,34,871 acres (4,99,725 hectares) compared to 11,74,978 acres (4,75,488 hectares) of the last year. Comparative area estimates of potato are shown below;

## Production

Total potato production has been estimated 102,15,957 metric tons compared to 94,74,098 metric tons of the last year which is 7.83% higher. This production figure is very important for Bangladesh because of this is the first time cross one core metricton. A comparative estimate of potato production are shown below:
